

Highlights of GAO-14-299, a report to congressional requesters

March 2014

MARITIME INFRASTRUCTURE

Key Issues Related to Commercial Activity in the U.S. Arctic over the Next Decade

Why GAO Did This Study

Decreasing seasonal sea ice has opened up Arctic waters for longer periods with resulting potential economic opportunities in commercial shipping, cruises, commercial fishing, oil, and mining. In light of the importance of U.S. efforts to effectively manage Arctic issues, GAO was asked to examine U.S. actions related to developing and investing in Arctic maritime infrastructure.

This report discusses (1) current commercial maritime activity in the U.S. Arctic and anticipated activity in the next 10 years, (2) actions taken by government entities in support of planning and developing U.S. Arctic maritime infrastructure, and (3) federal interagency efforts to identify and prioritize Arctic maritime-infrastructure investments. GAO interviewed representatives from the commercial-shipping, cruise, commercial-fishing, oil, and mining industries and government entities involved in the U.S. Arctic. Site visits were conducted to Nome, Barrow, and Anchorage, Alaska. These sites were selected based on factors such as geographic location and infrastructure activity.

What GAO Recommends

GAO is not making recommendations in this report. USCG, NOAA, the Department of Transportation, and the Department of the Interior sent GAO technical comments on this report, which were incorporated as appropriate. USACE did not have any comments on this report.

What GAO Found

Commercial U.S. Arctic maritime activities are expected to be limited for the next 10 years, according to industry representatives, due to a variety of factors. Interviews with industry representatives highlighted a variety of general challenges related to operating in the Arctic, such as geography, extreme weather, and hard-to-predict ice floes. Industry-specific factors were also cited as contributing to limited commercial activity. For example, shipping companies noted higher costs with Arctic transit; cruise industry groups noted a lack of demand for Arctic cruises from the mainstream cruise-consumer base, and oil companies last drilled offshore exploratory wells in the U.S. Arctic in 2012.

Although the activity will likely be limited, federal, state, and local stakeholders have taken some actions to plan for future maritime-infrastructure investments. Some of these actions address factors that, as identified by industry representatives, contribute to the current and expected limited maritime activity in the U.S. Arctic. For example, the U.S. Army Corps of Engineers (USACE), in collaboration with the State of Alaska, has taken steps to study the development of an Arctic deepwater port; the lack of which is a factor identified by mining representatives as contributing to the expected limited mining activity in the U.S. Arctic. The U.S. Coast Guard (USCG) is in the preliminary phase of seeking to acquire a new polar icebreaker, which could be used for emergency response, research assistance, or patrols. The National Oceanic and Atmospheric Administration (NOAA) and the Alaska government are working to improve mapping, charting, and weather information for the U.S. Arctic.

The Committee on the Marine Transportation System (CMTS) published the *U.S. Arctic Marine Transportation System: Overview and Priorities for Action* in July 2013, which prioritized actions for developing Arctic maritime infrastructure and identified the lead agency for each action. This report prioritized two broad categories to be addressed in the near term: information infrastructure, such as mapping and charting, and response services, such as search and rescue. Implementation of the report's actions is at the discretion of each federal agency; however, according to CMTS officials, CMTS is currently developing a process to regularly monitor agencies' progress in addressing the recommended actions.
